Sequences AAY77154-Y77174 represent novel peptides capable of binding to and activating human fibroblast growth factor receptor (FGFR). The peptides of the invention have amino acid sequences that are unrelated to that of the human FGFR or to those of prior art FGFR-binding peptides. The peptides were isolated from phage display libraries via their ability to bind an FGFR probe. Peptide 13-1 (AAY77161) was used as the basis for the construction of an evolved phage display library, which led to the identification of further peptides (AAY77168-Y77174, consensus sequence AAY77153) capable of binding human FGFR. The peptides (or peptide mimetics) can be used to activate human FGFR, or can be used as competitive inhibitors to inhibit the binding of FGF to its receptor. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide useful as a receptor agonist or antagonist in treating wounds and promoting angiogenic capability, and as a model for designing small molecules with agonist or antagonist activity.
                                                                                                                                                                                                                                                                                                                                                    Fibroblast growth factor receptor; FGFR ligand, activation; phage display library; agonist; antagonist; drug screening; competitive inhibitor; angiogenic; wound healing.

The present invention describes a solid phase method for the synthesis of peptide-spacer-lipid conjugates, and targeted liposomes containing the conjugates. The method comprises: (a) synthesising an amino acid residue protected peptidyl resin, in solid phase; (b) conjugating a spacer and a lipid to the peptidyl resin; (c) cleaving the peptide-spacer-lipid resin; (d) removing at least one side chain protecting group from at least one amino acid of the peptide-spacer lipid, forming a peptide-spacer-lipid conjugate; and (e) subjecting the conjugate to: (i) no further processing; (ii) modifying a peptide portion of the conjugate to a cyclic form after conjugate to: (i) no further processing; (ii) modifying a peptide portion of the conjugate to a cyclic form after can of the lipid by linkage functional groups, the 2 linkage functional groups being the same or different. Also described: (l) a functional groups being the same or different. Also described: (l) a peptide-spacer-lipid conjugate, and (2) a targeted therapeutic liposome comparising a peptide-spacer-lipid conjugate, and optionally a therapeutic agent for treating a disease or a diagnostic agent for diagnosing a
                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             phase synthesis; peptide-spacer-lipid conjugate; targeted liposome; tatic; somatostatin receptor 2 inhibitor;
invention also encompasses methods of screening drugs that mimic human FGF. The peptides are useful as FGFR agonist or antagonist therapeutic agents for treating wounds and promoting angiogenesis. The peptides are also useful as a model for designing small molecules which have FGFR
                                                                           agonist or antagonist activity. The peptides are stable and economical, and are alternatives to expensive recombinant FGF or FGF isolated from animal tissue. In addition, they have an improved therapeutic delivery
                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          new peptide-spacer-lipid

This invention relates to a novel solid phase synthesis method for preparing peptide-spacer-lipid conjugates. Specifically, it refers to preparing peptide-FBG-lipid conjugates and it provides the various linkage groups (such as amide groups) required for such a conjugation. The present invention describes an automated method for producing a wide range of conjugates that is simple and minimises product loss during synthesis. Furthermore, the peptide-spacer-lipid can be incorporated into specific cells, and as such can be useful for the treatment and diagnosis of certain diseases including somatostatin receptor expressed cancer. Accordingly, these compositions exhibit cytostatic activity. This peptide sequence is a peptide ligand component of a conjugate of the invention.
                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Solid phase synthesis of peptide-spacer-lipid conjugates useful for synthesizing targeted therapeutic liposomes for treating or diagnosing a disease e.g. cancer involves conjugating a spacer and a linker to a
                                                     into targeted therapeutic liposomes containing therapeutic or diagnostic agents, e.g. for targeted treatment of a somatostatin receptor expressed cancer. The present sequence represents a fibroblast growth factor peptide ligand used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fibroblast growth factor peptide ligand 1 of a peptide-lipid conjugate.
                     and can be used as somatostatin receptor 2 inhibitors. The method is us for the synthesis of peptide-spacer-lipid conjugates for incorporation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel peptide sequences capable of translocating across a blological barrier. Furthermore, it refers to methods that use these peptides to facilitate penetration of a biologically active effector molecule such as a drug or other therapeutic agent across blological barriers e.g. epithelial or endothelial cells sealed by tight junctions. This peptide is derived from a bacterial toxin, an integral membrane or extracellular protein and can comprise an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                anticoagulant, antibiotic, antipathogenic agent, immunomodulator, vitamin or enzyme. The effector molecule, however, can comprise for example insulin, gonadotropin, erythropoietin, granulocyte/monocyte colony stimulating factor (GM-CSF), enhephalin, dalargin, or neurotrophic factors. The penetrating peptide is useful for the treatment of various conditions including diabetes, infertility, hormone and vitamin deficiencies, neurodegenerative, cardiovascular, haematological and endocrine disorders, as well as obesity and neoplastic disease.

Accordingly, the peptides of this invention can be used in compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New penetrating peptide, useful for preparing a composition for treating or preventing e.g. endocrine disorders.
                                                                                                                                                                                                                                                                                                                                   diabetes;

The present amino acid sequence is a pCBCI plasmid amyloid precursor protein (APP) beta-secretase cleavage site (AABO0611) (NL/KI) mutant. APP sequence containing this mutantion is less susceptible to beta-secretase cleavage. APP beta-secretase cleavage site is used to construct an artificially engineered chimeric cassette comprising human caspase-3 with interdanin linker replaced by swedish mutant beta-secretase cleavage site. This modified caspase-3 plays a pivoral role in Alzheimer's disease. Caspases are a family of cysteine proteases, that participate in the intiation and execution of apoptosis. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion polypeptide is used to identify a mutant cell line deficient in an enzyme of interest and is also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel fusion polypeptide comprising first and second caspase subunit separated by cleavage site not associated in nature with caspase subunit, useful for cloning gene encoding enzymes involved in proteolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by overexpression of a polypeptide (e.g. Cathepsin B or urokinase, selectively expressed in the tumour cells). DNA encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAW15694-99 represent 15-20 residue peptides of white faced hornet antigen 5 molecule. The invention relates to peptides derived from vespid venom antigen 5 (VV5) that are antigenic for T cell proliferation in mice immunised with VV5. The peptides can be used to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vespid venom sensitivity e.g. to Dolichovespula maculate (white face hornet), Vespula vulgaris (yellowjacket), V. maculifrons (yellowjacket), D. arenaria (yellow hornet), Polistes ammularis (wasp), P. exclamans (wasp), V. crabo (European hornet), V. flavopilosa (yellowjacket), V. germanica (yellowjacket), V. squamosa (yellowjacket), V. vidua (yellowjacket) and P. fuscatis (paperwasp)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel peptides, designated GD domains, which are capable of modulating apoptosis. The GD domains are essential for Bak's cell killing function. The GD domains mediate key protein/protein interactions with multiple cell death regulatory molecules. Also described are methods of identifying agonists or antegonists of GD domains. The methods are useful for identifying agents capable of modulating GD domain mediated heterodimerisation or homodimerisation. The methods are particularly useful in drug screening and design, e.g. for identifying agents for treating autoimmune disease or cancer, or for identifying modulators of apoptosis. The present sequence represents a peptide tested for it's ability to block GD domain-mediated interactions
                                                                                                                                                                                                                                                                       Identifying agents (e.g. modulators of apoptosis) capable of modulating GD domain mediated heterodimerization or homodimerization comprises carrying out a heterodimerization or homodimerization assay.

The invention describes an isolated and purified peptide (I) comprising unrecognised protein domain (GD domain) isolated from the bcl-2 related gene Bak that can induce cell death. (I) is useful for identifying an agent Capable of modulating GD domain radiated heterodimerisation or homodimerisation. (IV) is useful for screening a cDNA expression library for clones comprising DNA inserts encoding immunocrossreactive proteins (Claimed). An anti-(I)-antibody, its mimetics, fragments, functional equivalents and/or hybrids or its mimetics, fragments, functional equivalents and/or hybrids or its mintants, and a vector comprising a polymucleotide encoding (I) are useful as agents for treating a polymucleotide encoding (I) are useful as agents for treating proliferation or inappropriate cell death. The agents are also useful for treating disorders in which a cell is present and/or persists in an impropriate (SLE) and nheumatoid arthritis. The degenerative disorders in which a call is present and/or persists in an expremance (SLE) and nheumatoid arthritis. The degenerative disorder include acquired immunodeficiency syndrome (ALDS). This is the amino acid sequence of a Bcl-2 family member Bip-la GD domain peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present invention describes fluorogenic compositions which can be used for the detection of protease activity. This can be useful as an indicator of viral infection, cancer metestasis, haemophilia, emphysema, thrombosis and arthritis. The fluorogenic compositions comprise a peptide, a peptide spacer and a donor and an acceptor fluorophore. The expetide is cleaved by a protease and the fluorophores can then be detected. The present sequence is one of the peptides described in the exemplification of the invention
                                                                                                                                                                                                    New fluorogenic compositions whose fluorescence level increases in the presence of active proteases, useful for detecting and localizing protease activity in biological samples, particularly in frozen tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protease detection; peptide cleavage; enzyme activity; fluorogenic; viral infection; cancer metastasis; emphysema; arthritis; thrombosis; haemophilia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä
                                                                                                                                                                                                                                                                                                                                                                                        AAW82023-W82240 are peptides used in the construction of a fluorogenic composition which is used for the detection of protease activity in biological samples. The products can be used for the detection of conformation changes in nucleic acids, oligosaccharides, proteins, peptides, lipids, phopholipids, glycolipids, glycoproteins, steroids or polymers. In addition, attachment of a hydrophobic group to amolecule can be used to enhance uptake by cells. The composition is composed of P = peptide compraising a protease binding site for the protease, Fl, F2 peptides = fluorophores where Fl is attached to the amino terminal amino acid and Sl, S2 peptides = when present, are peptide spacers where S1, when present, is attached to the amino terminal acid, and S2, when present, is attached to the amino terminal acid, and S2, when
                                                                                                                                                                                                                                                                             New fluorogenic compositions - containing 2 fluorophores separated by a peptide comprising a protease binding site, used for detecting protease activity in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protease detection; peptide cleavage; enzyme activity; fluorogenic; viral infection; cancer metastasis; emphysema; arthritis; thrombosis; haemophilia.

(I) is useful for detecting the activity of a protease, which involves contacting the protease with (I), where the activity of protease so detected in a histological section, cell culture or tissue section. The cell suspension is derived from the biological sample chosen from tissue, blood, urine, saliva, lymph or biopsy. The protease activity is detected by fluorescence microscopy, fluorescence microplate reader, absorption microplate reader, flow cytometry, fluorometry, absorption spectroscopy or confocal fluorescent microplate reader. (I) is useful for delivering a molecule into a cell, and for
                                                                                                                                            used for the detection of protease activity. This can be useful as an indicator of viral infection, cancer metastasis, haemophilia, emphysema, thrombosis and arthritis. The fluorogenic compositions comprise a peptide, a peptide spacer and a donor and an acceptor fluorophore. The epptide is cleaved by a protease and the fluorophores can then be detected. The present sequence is one of the peptides described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fluorogenic composition useful for detecting protease activity and test
New fluorogenic compositions whose fluorescence level increases in the presence of active proteases, useful for detecting and localizing protease activity in biological samples, particularly in frozen tissue
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                           present invention describes fluorogenic compositions which can

The invention relates to a fluorogenic composition (I) for detecting the activity of a protease. (I) is useful for detecting the activity of a protease. (I) is useful for detecting the activity of a crivity of protease is detected in a histological section, cell culture or tissue section. The cell suspension is derived from the biological sample chosen from tissue, blood, urine, saliva, lymph or biopsy. The protease activity is detected by fluorescence microsopy, fluorescence microplate reader, absorption microplate reader, flow cytometry, fluorometry, absorption spectroscopy or confocal fluorescent microplate reader. (I) is useful for delivering a molecule into a cell, and for screening a test agent for the ability to modulate the activity of the protease. (I) is useful for detection and localisation of protease activity in biological samples. (I) also acts as a protease inhibitor, thus useful as protease inhibitors. (I) enables detection of the protease activity, and provides a high intensity fluorescent signal at a visible wavelength when they are digested by a protease. The present sequence represents a fluorogenic protease indicator peptide of the invention.
screening a test agent for the ability to modulate the activity of the protease. (I) is useful for detection and localisation of protease activity in biological samples. (I) also acts as a protease inhibitor, thus useful as protease inhibitors. (I) enables detection of the protease activity, and provides a high intensity fluorescent signal at a visible wavelength when they are digested by a protease. The present sequence represents a fluorogenic protease indicator peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fluorogenic composition useful for detecting protease activity and test

The BBC3 protein, nucleic acids and antibodies are suitable for use in promoting cell death or for preventing apoptosis in malignant cells and those causing autoimmune diseases

| Sequence 114, Application US/08802981
| Patent No. 6037137
| GENERAL INFORMATION:
| APPLICANT: Romoriya, Akira
| APPLICANT: Packard Beverly S.
| TITLE OF INVENTION: Compositions for the Detection of Enzyme
| TITLE OF INVENTION: Activity in Biological Samples and Methods of Use Thereof
| TITLE OF INVENTION: Activity in Biological Samples and Methods of Use Thereof
| NUMBER OF SEQUENCES: 231
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: Two Embarcadero Center, Eighth Floor
| STREET: Two Embarcadero Center, Eighth Floor
| STREET: Control of Enzyme

Patent No. 5597569
GENERAL INFORMATION:
APPLICANT: Siegall, Clay B.
APPLICANT: Gavlar, Susan L.
APPLICANT: Marquardt, Hans
TITLE OF INVENTION: A NEW RIBOSOME-INACTIVATING PROTEIN
TITLE OF INVENTION: ISOLATED FROM THE PLANT BRYONICA DIOICA
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:
                                                                           APPLICANT: Baker, James R.
APPLICANT: Recaig, Ronald J.
APPLICANT: Koenig, Ronald J.
APPLICANT: William Septicant J.
APPLICANT: University of Michigan
TITLE OF INVENTION: THYROID PEROXIDASE EPITOPIC REGIONS
FILE REFERENCE: 203442065801
CURRENT APPLICATION NUMBER: US/09/251,039
CURRENT PILING DATE: 1999-02-18
